An argument that the increasing high frequency climate variation in the Pleistocene drove the evolution of human culture capacities:

Evidence that the social modernization of the past two centuries was a result of the restructuring of social networks so that they included fewer kin and more non-kin:

Why did a more or less steady increase social complexity occur in the Holocene? Why did it not more rapidly reach some sort of equilibrium rather than continue a slow increase Institutional complexity for more than 10,000 years, capped by a burst of more rapid change in the last few centuries? The first part of this paper includes an introduction to Boyd's and my basic approach to cultural evolution:
